

NEXERRA TALENT OS

Product Hierarchy, Multi-Tenant Architecture & End-to-End Flow

Purpose: This document defines the product foundation for rebuilding Nexerra Talent OS from scratch. It establishes the Master Admin → Company → Sub-User hierarchy, tenancy boundaries, quotas, permissions, and recruitment operating flow before implementation begins.

1. Core Product Idea

Nexerra Talent OS is a multi-tenant recruitment operating system. A single Master Admin controls the platform and provisions recruitment companies. Each company operates as an isolated organization/tenant. The company administrator can create sub-users, but only within the number of seats/users allocated by the Master Admin.

PLATFORM

- MASTER ADMIN
- COMPANY / ORGANIZATION
- COMPANY ADMIN
- SUB-USERS
- RECRUITMENT OPERATIONS
- TALENT INTELLIGENCE

2. Three-Level Hierarchy

Level	Actor	Primary Responsibility
1	Master Admin	Creates and manages companies, plans, quotas, feature access, platform usage, account status and plan
2	Company / Organization	An isolated customer tenant containing its users, candidates, jobs, clients, interviews, offers, emails and
3	Company Sub-Users	Recruiters, hiring managers, interviewers, read-only users and other company employees operating insi

3. Master Admin Flow

Master Admin is the platform-level administrator. The Master Admin should manage customer organizations and platform configuration, rather than functioning as a normal recruiter inside customer data.

MASTER ADMIN LOGIN

- Master Dashboard
- Create Company
- Select Plan / Limits
- Assign User Seats
- Assign Storage / AI / Feature Limits
- Create Company Admin
- Send Invitation
- Company Activated

Company creation should provision the organization, its initial administrator, quotas, feature configuration, default settings and audit records.

4. Company / Tenant Flow

Each company is an isolated tenant. Company users should only be able to access records belonging to their own organization. The tenant boundary must be enforced at the backend/database level, not merely by hiding items in the frontend.

COMPANY ADMIN LOGIN

- Company Dashboard

- Company Profile / Settings
- Users & Teams
- Create Recruiters / Employees
- Connect Gmail (optional)
- Import / Upload Candidates
- Create Jobs
- Begin Recruitment Operations

5. Sub-User Creation & Seat Allocation

The Master Admin assigns the maximum number of active users/seats to a company. Company Admin can create users only while the active-user count remains within that allocation.

Example:

Master Admin allocation = 10 seats

Company currently uses = 4 seats

Available = 6 seats

When Company Admin creates another user:

4 → 5 used

5 → available

When all seats are used, the company should see a Request Additional Seats action. The request is reviewed by the Master Admin, who can approve or reject it.

6. Recommended Roles

Scope	Role	Purpose
Platform	MASTER_ADMIN	Full platform administration and customer provisioning.
Company	COMPANY_OWNER	Highest company-level operational authority.
Company	COMPANY_ADMIN	Users, teams, settings and recruitment administration.
Company	RECRUITER	Candidate, job, search, matching and recruitment workflow.
Company	HIRING_MANAGER	Job and candidate review with limited operational permissions.
Company	INTERVIEWER	Interview and scorecard activities.
Company	READ_ONLY	View-only access to permitted company data.

7. Roles vs Permissions

Do not hard-code the entire authorization model around role names. Use roles as bundles of permissions, then check permissions against resources/actions.

USER

→ ROLE

→ PERMISSIONS

→ RESOURCE

→ ACTION

Example:

Recruiter → candidate.read + candidate.create + candidate.edit + candidate.match + job.read + interview.manage

8. Tenant Data Isolation

Every organization-owned business record should carry an organization_id (or equivalent tenant key). Database-level row security should enforce that authenticated users can only access records belonging to their organization.

```
organizations
■■■ users
■■■ teams
■■■ clients
■■■ jobs
■■■ candidates
■■■ interviews
■■■ offers
■■■ emails
■■■ talent_pools
■■■ audit_logs
```

For example, Candidate A can belong to Organization ABC while Candidate B belongs to Organization XYZ. ABC users must never be able to query or modify XYZ's candidate records.

9. Recruitment Operating Flow

```
COMPANY
→ CREATE JOB
→ DEFINE REQUIREMENTS
→ RESUME SOURCES
  • Gmail
  • Upload
  • Existing Database
→ INGESTION
→ RESUME PARSING
→ CANDIDATE PROFILE
→ SKILL NORMALIZATION
→ DUPLICATE DETECTION
→ TALENT DATABASE
→ AI MATCHING
→ HUMAN REVIEW
→ SHORTLIST
→ INTERVIEW
→ OFFER
→ ONBOARDING
→ PLACED
```

10. Product Differentiation

The product should not be designed merely as an ATS that stores resumes. The intended product concept is a Talent Operating System that continuously turns recruitment inputs and historical candidate data into searchable, reusable talent intelligence.

```
Resume arrives
→ Candidate extracted
→ Skills identified
→ Experience calculated
→ Candidate normalized
→ Duplicate checked
→ Talent graph/database updated
→ Candidate matched to jobs
→ Recruiter notified
→ Recruitment workflow continues
```

Historical rediscovery is important: when a new job is created months later, the system should search the existing talent database and surface relevant historical candidates rather than relying only on newly uploaded resumes.

11. Agency Model

For recruitment agencies, a company can contain multiple clients and jobs while recruiters work across those client relationships.

AGENCY / COMPANY
 ■■■ Recruiters
 ■■■ Clients
 ■ ■■■ Client A
 ■ ■■■ Client B
 ■ ■■■ Client C
 ■■■ Jobs / Candidates / Talent Pools

12. Main Product Modules

Area	Modules
Platform	Master Admin, Organizations, Plans, Subscriptions, User Quotas, Feature Flags, Usage, Audit, System Health
Organization	Company Admin, Users, Teams, Roles, Clients, Settings, Usage
Recruitment	Jobs, Candidates, Talent Pools, Search, Matching, Shortlists, Interviews, Offers, Onboarding
Intelligence	Resume Parsing, Skill Extraction, Candidate Matching, Rediscovery, Candidate Summary, Job Analysis, Search, Copilot, Ta
Communication	Gmail, Email, Campaigns, Templates, Interviews, Notifications
Analytics	Recruitment Funnel, Recruiter Performance, Job Performance, Candidate Analytics, Client Analytics, Placement Analytics

13. Account Lifecycle

CREATED
→ INVITATION_SENT
→ ACTIVATED
→ ACTIVE
→ SUSPENDED (optional)
→ DEACTIVATED

Suspension should disable access while preserving customer data. Deactivation should be a controlled lifecycle state, not an uncontrolled deletion operation.

14. User Lifecycle

INVITED
→ ACTIVE
→ INACTIVE / SUSPENDED
→ REACTIVATED (optional)

When a user becomes inactive, historical activity should remain for audit purposes. Do not destroy recruitment history simply because an employee leaves.

15. MVP Build Order

Phase	Build
Phase 1 — Foundation	Authentication, Master Admin, Organization creation, Company Admin, seat allocation, sub-user creation, roles/perm
Phase 2 — Recruitment Core	Jobs, Candidates, Resume Upload, Candidate Profiles, Pipeline, Search, Notes, Tags.
Phase 3 — Intelligence	Resume Parsing, Skill Extraction, Duplicate Detection, AI Matching, Rediscovery, Talent Pools, Copilot.
Phase 4 — Operations	Interviews, Scorecards, Offers, Onboarding, Email, Gmail.
Phase 5 — SaaS	Plans, Usage, Billing, Feature Limits, Subscriptions, Client Portal, Advanced Analytics.

16. Final Product Architecture

PLATFORM

- MASTER ADMIN
- ORGANIZATIONS
- COMPANY ADMIN
- ■■■ USERS / TEAMS
- ■■■ ROLES / PERMISSIONS
- ■■■ SEATS / QUOTAS
- ■■■ SETTINGS
-
- RECRUITMENT DATA
 - Jobs
 - Candidates
 - Clients
 - Interviews
 - Offers
 - Talent Pools
 - Emails
 - Analytics

17. Non-Negotiable Foundation Rules

1. Master Admin controls customer provisioning.
2. Every customer is an isolated organization/tenant.

3. Company Admin controls sub-users within allocated seats.
4. Authorization is based on permissions, not only UI visibility.
5. Tenant isolation is enforced server-side and at the database level.
6. User deactivation does not erase historical activity.
7. Suspension preserves customer data.
8. Quotas are enforced by the backend, not only the frontend.
9. Audit logs capture important administrative and recruitment actions.
10. Build the hierarchy and security foundation before implementing advanced AI features.

Product definition: Nexerra Talent OS is a multi-tenant recruitment operating system where a platform Master Admin provisions recruitment companies, each company manages its own users and recruitment operations within allocated limits, and the system continuously converts resumes, email, jobs, candidates, interviews and historical hiring data into intelligent, reusable talent data.

Prepared as the initial product-flow specification for the Nexerra Talent OS rebuild.
